3. Project Design Phase

Streamlining IT Procurement: Automating Standard Laptop Orders with ServiceNow Flow Designer

3.1 Design Overview

The project design defines how the requirements identified in the Requirement Analysis Phase will be implemented in ServiceNow. ServiceNow Flow Designer is used to connect the request, validation, approval, fulfillment, and completion activities into one automated process.

3.2 Proposed Process Flow

Employee submits request → **Validate request** → **Verify employee details** → **Request approval** → **Approved?** → **Create fulfillment task** → **Update status** → **Complete request**

If the request is rejected, the request status is updated as rejected and the fulfillment process stops.

3.3 ServiceNow Flow Designer

Flow Designer is the main automation component of the project. The screenshot below shows the ServiceNow interface where Flow Designer is accessed under Process Automation. This is the platform component used to build the automated laptop-order workflow.

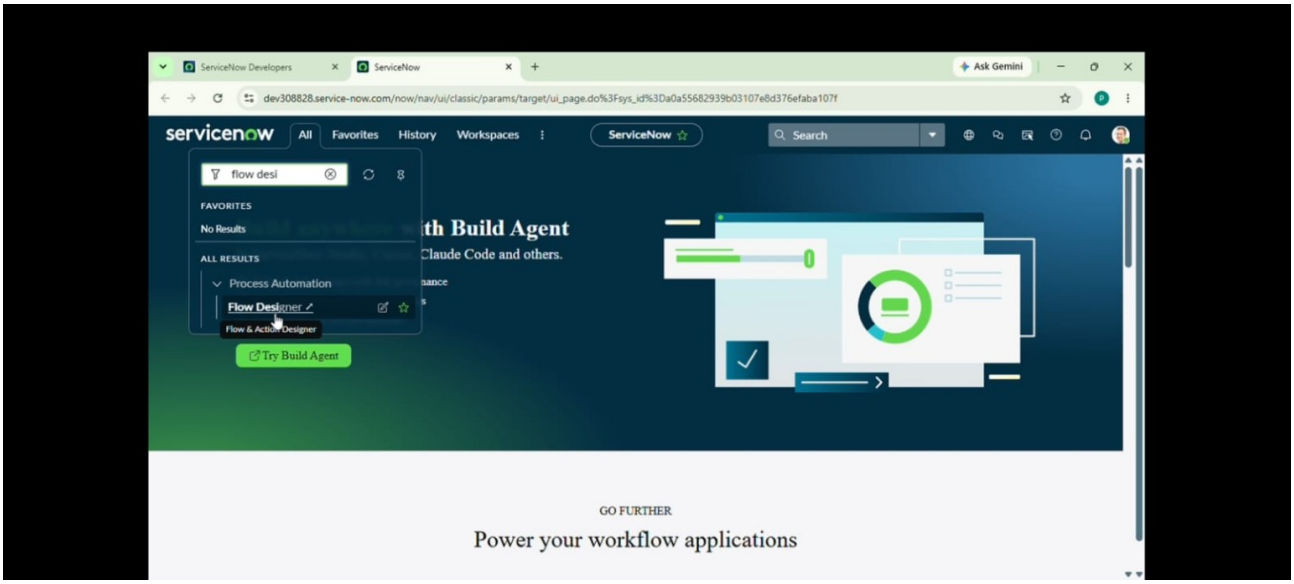

Figure 1: ServiceNow Flow Designer accessed under Process Automation.

3.4 Approval Design

After a standard laptop request is submitted and validated, the flow sends the request for approval. The approval result controls the next stage of the workflow: approved requests proceed to fulfillment, while rejected requests are closed or marked as rejected.

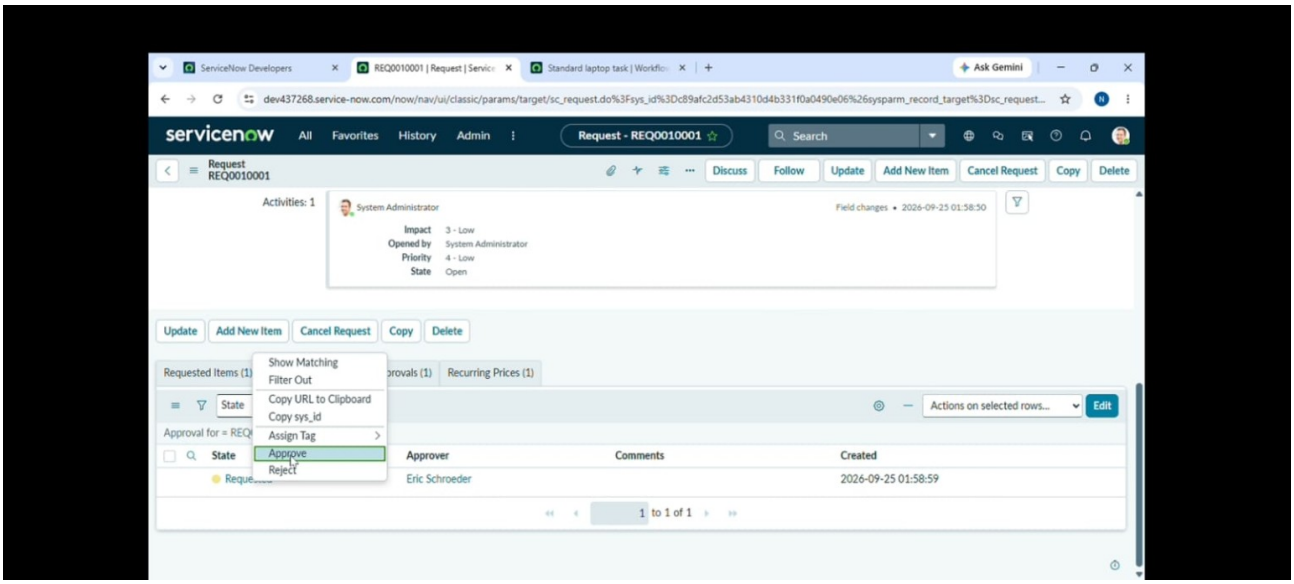

Figure 2: Approval action available on the ServiceNow request.

3.5 Detailed Flow Components

Component	Design
Trigger	Start the flow when a standard laptop request is submitted.
Validation	Check that required request and employee details are available.
Approval	Send the request to the appropriate approver.
Decision	Continue only when the request is approved; otherwise update the request as rejected.
Fulfillment Task	Automatically create and assign the laptop fulfillment task to the responsible team.
Status Update	Update the request state as processing progresses.
Completion	Mark the request as completed after fulfillment is finished.

3.6 Design Outcome

The proposed design provides a structured and traceable workflow for standard laptop procurement. By connecting request submission, approval, fulfillment, and status updates through Flow Designer, the process can reduce repetitive manual work and provide consistent handling of laptop requests.
