2. Requirement Analysis Phase

Streamlining IT Procurement: Automating Standard Laptop Orders with ServiceNow Flow Designer

2.1 Requirement Overview

The project aims to streamline the IT procurement process for standard laptop orders using ServiceNow Flow Designer. The requirement analysis identifies the information, activities, approvals, and automation needed to process a laptop request from submission to completion.

2.2 Functional Requirements

1. Employees should be able to submit a standard laptop request.

2. The system should capture required request details such as employee information, department, laptop type, and request reason.

3. The request should be checked for required information before further processing.

4. The request should be routed to the appropriate approver.

5. An approved request should generate a fulfillment task for the responsible IT/procurement team.

6. The request status should be updated as the process moves through different stages.

7. The system should maintain request and approval information for tracking.

8. Rejected requests should be identified and stopped from further fulfillment.

2.3 Non-Functional Requirements

Reliability: The automation should process requests consistently.

Efficiency: Manual processing effort should be reduced through automation.

Accuracy: Request and employee details should be processed correctly.

Security: Request and approval activities should be accessible only to authorized users.

Maintainability: The Flow Designer process should be easy to maintain and update.

2.4 Required Inputs and Outputs

Inputs	Outputs
Employee name / ID Department Laptop type Request reason Request details	Approval request Fulfillment task Updated request status Completed or rejected request

2.5 Requirement Evidence – ServiceNow Request

The screenshot below shows a ServiceNow request record with its state and request information. It provides evidence that the project works with a request-based IT procurement process.

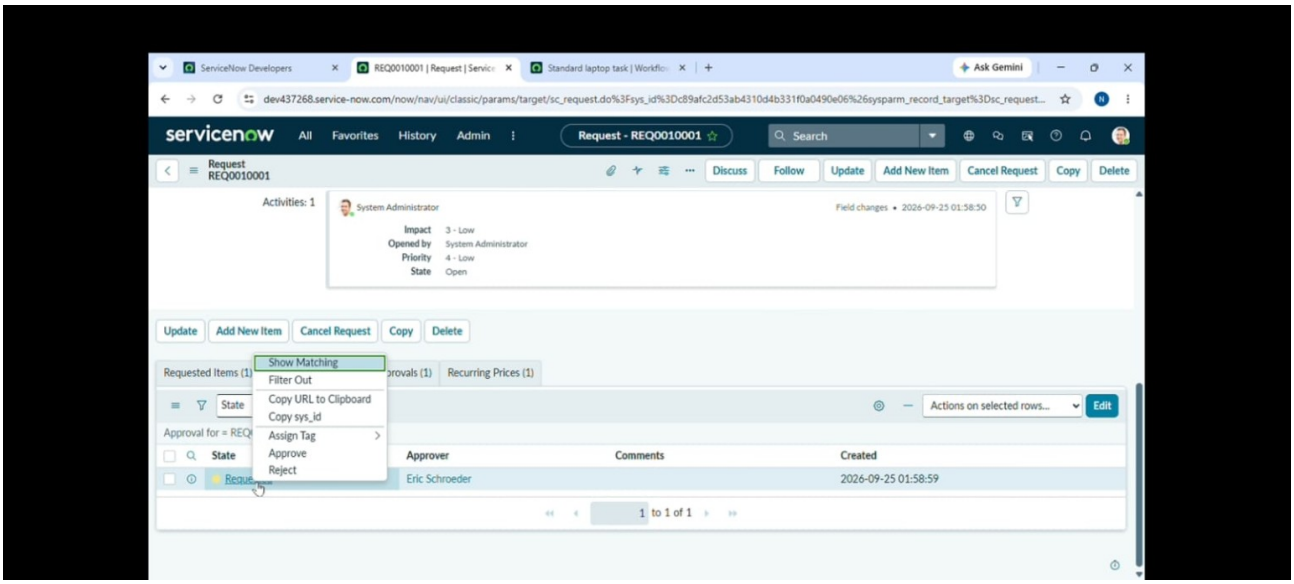

Figure 1: ServiceNow laptop procurement request record.

2.6 Approval Requirement

The request includes an approval stage. The approval record shows an assigned approver and provides options to approve or reject the request. This supports the requirement that laptop procurement should not proceed to fulfillment without the required approval.

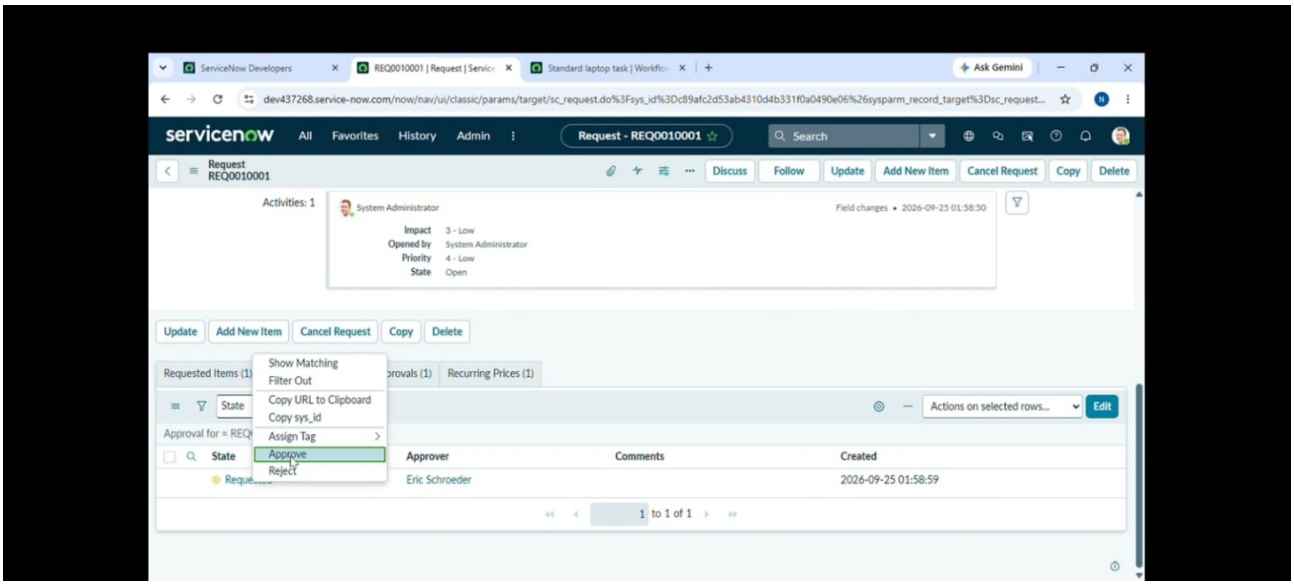

Figure 2: ServiceNow approval record showing the approval action.

2.7 Requirement Summary

The identified requirements establish the basis for designing an automated laptop procurement flow. The next phase converts these requirements into a structured ServiceNow Flow Designer design containing triggers, actions, approval logic, fulfillment tasks, and status updates.
